Global Leaders in Dynamic Protection for Equipment and People

PRECISION SLIP CLUTCHES

MECHANICAL CLUTCHES • PNEUMATIC SLIP CLUTCHES

DYNATECT.DE
How to determine the perfect clutch for your application

Three factors in determining the right clutch are:
- the maximum shaft size
- torque capacity of the clutch
- wattage capacity

Maximum wattage capacities are listed for each model in the series specifications. Please consider the maximum torque capacities when making your selection.

CONTINUOUS SLIP CLUTCHES

...solve many design engineering problems

Polyclutch slip clutches can slip continuously or intermittently for over 30 million cycles.

This opens up many design engineering options including:

<table>
<thead>
<tr>
<th>OVERLOAD PROTECTION</th>
<th>SOFT STARTS/ CUSHIONED STOPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protect machinery and operator. Clutch will slip when mechanism is jammed. Motion will continue when impediment is removed.</td>
<td>Inertia makes clutch slip when starting and/or stopping. Results in less shock throughout the system. Ideal for slip at the end of stroke.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TENSION CONTROL</th>
<th>POSITIONING HINGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maintain constant tension while winding or unwinding wire, paper, film, thread, etc. Slip clutch automatically compensates for changes in speed and diameter. Pneumatic clutch can change tension during operation.</td>
<td>Hold lid, cover, door, light fixture, screen, etc., at any position. Fingertip control. Combine with one way clutch for free movement in one direction.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TORQUE CONTROL</th>
<th>FORCE CONTROL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Screw bottle caps, screws, controls, etc. to correct torque setting. Combine with one way clutch to slip at rated torque in one direction and freewheel or positive drive in other direction.</td>
<td>Push product against gate with constant force. Remove gate and move to next position. No damage to product or conveyor – clutch does all the slipping. Also used for overload protection when jammed and for indexing the conveyor.</td>
</tr>
</tbody>
</table>
About Precision Slip Clutches

PolyClutch eliminates stiction

Polyclutch has developed a unique technology and manufacturing process, resulting in static friction that is lower than dynamic friction. This characteristic generates repeatable torque control and smooth operation while slipping.

- No sudden shock on sensitive paper, film, wire, thread, etc.
- Repeatable cushioned torque for protection during overload
- Ideal for friction hinges when smooth movement of lids, doors, screens, covers, etc. is required

- Smooth, accurate starting/stopping of conveyors, indexing mechanisms, linear actuators, etc.
- Repeatable accurate torque for capping machines, automatic screw driving, valve control, etc.

Our proprietary burn-in process ensures that all Polyclutch Slip Clutches will perform consistently right out of the box, with no break-in period required.

Applications:
- Overload Protection (machine and personnel safety)
- Torque Control (bottle capping, fastener driving)
- Tension Control (printing, stamping, labeling and take-up reels)
- Positioning Hinge (covers, medical equipment, light fixtures)

A Great Alternative To:
- Servo-Motors: our solution costs less
- Magnetic clutches: smaller, less expensive
- Ball detent: no clicking, no reset required
- Torque limiters: consistent repeatability, continuous slip
- Electronic protection only: added mechanical safety in electronically controlled systems

Key Benefits:
- Smooth breakaway and continuous slip
- Long life of 20 to 30 million cycles in slip condition
- Torque range from 0.06 Nm to 85 Nm
- Fixed, adjustable or custom designs
- Clutches are bi-directional
- No lubrication needed
- Also available in stainless steel
- Compliant with RoHS regulations

Limitations:
- Maximum shaft size: 32 mm on a through-shaft
- Not to be used as a universal joint or a spring coupler
- Does not de-couple at overload
- Cannot be exposed to radiation

Please contact us if slip clutch would be directly exposed to weather or wash down.
POLYCLUTCH EXTENDS MACHINERY LIFE

Polyclutch adjustable slip clutches control the precise amount of torque to tighten bottle caps, without wear or breakage, in this capping line application. All the slippage is in the clutch, with no appreciable wear.

CONSTANT TORQUE GIVES YOU THE SLIP

A slip clutch acts as a continuous drag brake to meet the specific torque requirement for this unwind/rewind system application in a DATAMAX® bar code printer. Other applications apply constant tension to film, wire, thread, paper etc.
APPLICATION EXAMPLES

AUTOMATED KIOSKS

Polyclutch slip clutches are an integral part of many retail kiosks. As shown in this photo, a slip clutch is used to protect the sensitive drive mechanisms of these automated machines.

CAPPING MACHINES

The V-Series slipper is the ideal solution for torque control on capping machines. This example shows an application of a bottle capping machine for serum products in the biotechnology sector.

DISABLED ACCESS SYSTEMS

A Polyclutch slip clutch provides safety in many disabled access systems, as seen in this photo, where it is being used for overload protection in an automated door opener.
APPLICATION EXAMPLES

MRI BEDS

Polyclutch adds a mechanical safety feature for moving MRI beds for protecting the patient.

ICE-DISPENSING MACHINES

Hidden deep inside of this ice-making machine, a Polyclutch slip clutch prevents overload to the drive mechanism during the forming and dispensing of ice cubes.

RETAIL VENDING KIOSKS

A Polyclutch protects this machine against any type of overload or jamming during the process of dispensing a DVD.
APPLICATION EXAMPLES

**CONVEYORS**

Polyclutch slip clutches offer an added level of safety and protection to both the machine and its operators.

**LABEL PRINTERS**

Polyclutch slip clutches are the perfect solution for adding just the right amount of tension to any reel or spool without having to worry about the tension varying over time or wearing out prematurely.

**INSPECTION ROBOTS**

The Machine Lab Inc., an industry leader in defense robotics, uses two Polyclutch slip clutches in each robot arm for overload protection.
# SERIES 16

Our most compact model features big torque in a small package.

SLIPPER

The Polyclutch slipper controls torque for intermittent, continuous or overload slip. It contains a number of brass plates interfaced with long life friction material. Soft springs maintain pressure on the friction plates, assuring constant torque.

An adjacent component of your mechanism can often be used as the clutch housing, reducing overall cost or space concerns. Torque control in one direction can be achieved by combining with our one-way clutch.

Part Number Examples (see page 22 for part number identification)

**S A O 32 - 12 mm**
1 2 3 4 5
- 12 mm bore dia. in clutch cartridge and housing
- Series 32 (50.8 mm outside dia.)
- O = Shaft-through
- S = Shaft to shaft
- A = Adjustable torque
- F = Fixed torque (factory preset)
- Multi-Plate Slipper

**P F S 44 - 12 mm - 14 mm* T**
1 2 3 4 5 6
- 14 mm bore dia. in housing*
- 12 mm bore dia. in clutch cartridge
- Series 44 (69.85 mm outside dia.)
- S = Shaft to Shaft
- O = Shaft-through
- F = Fixed torque (factory preset)
- A = Adjustable torque
- Single-Plate Slipper

* Housing bore size needed only if different from cartridge bore size.
** T** Preset Torque Value, customer-specified
SLIPPER SPECIFICATIONS

For slip clutch operation and mounting options see pages 20 - 21.

Note: Multi-plate clutches shown. Single-plate clutch supplied with one set of friction plates and pads.

* Bore diameters (Dimension B) other than standards shown are available up to the maximum diameter.

Please note that torque capacities are only guidelines. Higher torques and speeds are possible depending on operating conditions.
The V-Series Slipper provides torque control for driving, capping and other applications where thrust loads are applied. Its integrated ball bearing allows thrust loads up to 295 kg without any effect on torque. Self-supporting hub design allows for easy installation; shaft-through support is not required. The V-Series slipper may be used for pulley applications; and its design allows rebuilding, if necessary.

**Horizontal and vertical installation without driveshaft modifications!**

Application with a module to tighten bottle caps

Application with tool holder (screwdriver)

**Part Number Examples** (see page 22 for part number identification)

**V A S 20 - 8 mm**

1  2  3  4  5

SLIP-EASE

Utilizes an axial loaded multi-plate design. For applications where space is at a premium and low backlash is required.

Part Number Examples (see page 22 for part number identification)

**E A S 32 - 8 mm - 10 mm***

1 2 3 4 5 6

10 mm bore dia. in housing*

8 mm bore dia. in clutch cartridge

Series 32
(41.28 mm outside dia.)

S = Shaft to shaft
O = Shaft-through

A = Adjustable torque
F = Fixed torque (factory preset)

Slip-Ease

**E F O 44 - 12 mm**

1 2 3 4 5

12 mm bore dia. in clutch cartridge and housing

Series 44
(57.15 mm outside dia.)

O = Shaft-through
S = Shaft to shaft

F = Fixed torque (factory preset)
A = Adjustable torque

Slip-Ease

* Housing bore size needed only if different from cartridge bore size.

**EXAMPLES:**

The maximum Watts capacity of the Polyclutch series EAS/EAO 52 is 85 Watts.

- At a torque of 17 Nm a Watts capacity of 82 Watts is calculated by:
  
  \[
  17 \text{ Nm} \times 50 \text{ RPM} \times 1 \text{ (= 100 %) duty cycle} \times 0.096
  \]

  This clutch will reach a life of 20-30 million cycles in continuous slip condition.

- The same values at a torque of 56 Nm result in a Watts capacity of 269 W. In this case the heat generation would be too high and can lead to failure. But if RPM and duty cycle are lower, the same life of 20 - 30 Millionen cycles can be achieved:
  
  \[
  56 \text{ Nm} \times 30 \text{ RPM} \times 0.5 \text{ (= 50 %)} \times 0.096 = 81 \text{ W}
  \]

  The same applies if duty cycles are at 100 %, but RPM is lower:
  
  \[
  56 \text{ Nm} \times 15 \text{ RPM} \times 1 \text{ (= 100 %)} \times 0.096 = 81 \text{ W}
  \]

  In this case the clutch will also reach a life of 20-30 million cycles in continuous slip condition.

  \(\odot\) Percent of the time the clutch is slipping, expressed as a decimal.

  For example: 0.25 = 25 % of the time the clutch is slipping.

  CAD drawings and models are available for download:
  
  www.dynatect.de/slip-clutch-polyclutch.html
For slip clutch operation and mounting options see pages 20 - 21.

* Smaller or larger bore dia. up to B max. = optional
** Maximum capacity is 56 Nm. Heat generation should not exceed maximum Watts capacity.
SLIP-AIRE

The Polyclutch Slip-Aire is an air actuated version of the mechanical Polyclutch slip clutch. It has the same long life friction plates, assuring constant torque or tension. With air actuation it can be used to engage/disengage, to vary the torque during operation, or to adjust the torque remotely at any time. Ideal for servo mechanisms, it transmits higher torque levels than comparably sized mechanical slip clutches.

Part Number Examples (see page 22 for part number identification)

**A A S 32 - 12 mm - 16 mm***

1. 16 mm bore dia. in housing*
2. 12 mm bore dia. in clutch cartridge
3. Series 32 (50.8 mm outside dia.)
4. S = Shaft to shaft
5. O = Shaft-through
6. A = Adjustable torque

**A A O 20 - 8 mm**

1. 8 mm bore dia. in clutch cartridge and housing
2. Series 20 (31.75 mm outside dia.)
3. O = Shaft-through
4. S = Shaft to shaft
5. A = Adjustable torque

* Housing bore size needed only if different from cartridge bore size.
For slip clutch operation and mounting options see pages 20 - 21.

**SLIP-AIRE SPECIFICATIONS**

AAS - Shaft-to-Shaft Version
set screws in housing
shafts must be in line
within 0.05 mm and supported

AAO - Shaft-Through Version
oil impregnated bronze
bearing in housing
adapt pulley, sprocket, gear,
frame, etc, to housing boss

1) Rated torque for continuous operation at 50 RPM. Torque can be higher or lower depending on actual RPM and duty cycle (see page 16).

2) Maximum torque attainable (at 7 bar).
CONSTRUCTION

A Polyclutch consists of two parts: a cartridge and a housing (see above). The cartridge includes the clutch pack: outer plates, friction pads, inner plates.

- The cartridge is set screwed or keyed to the input shaft
- Plates are brass with a proprietary finish
- Inner plates are keyed to the cartridge hub
- Outer plates are keyed to the cartridge housing
- Friction pads are a proprietary plastic-based composite (no asbestos)

The housing is either set screwed or keyed to the output shaft, or (as shown), attached to the output gear or pulley, with a bronze bearing to allow relative motion between the input shaft and the output gear/pulley.

Torque is controlled by changing the pressure applied to the clutch pack. In an adjustable style clutch, the torque level is controlled by compressing the springs with the adjusting nut. In a fixed style clutch, a collar is attached to the hub in a fixed position, and the torque level is set by pushing and locking the spring collar to a calibrated position.

All slip clutch torques are calibrated to +/- 20% but can be held to closer tolerances.

Backlash of 6° is standard for Slipper models and 2° for the Slip-Ease models. Slipper models can be held to 2° if required.

Our proprietary burn-in process ensures that all Polyclutch Slippers will perform consistently right out of the box, with no break-in period required.

INSTALLATION

(s. page 21 for mounting options)

Shaft-through versions: Insert input shaft into cartridge and tighten set screws. Insert housing around input shaft, with torque pins engaging holes in outer plates. Input shaft will keep the cartridge and housing aligned.

Shaft to Shaft versions: Insert input shaft into cartridge and tighten set screws. Insert output shaft into housing and tighten set screws. Input and output shafts must be properly journaled with centerlines within +/- .010 T.I.R.

Do not lubricate the clutch. Friction materials are designed to run without additional lubrication. Lubrication will cause a change in torque and erratic behavior. The inherent axial loaded design will keep dirt and dust out of the friction surfaces.

CAPACITY

The clutch capacity is based on continuous operation at 50 RPM for over 25 million cycles. Torque, RPM, duty cycle and life are interdependent. A reduction of any of these will allow an increase in any other. Running at 25 RPM will allow twice the torque, or running for only 10% of the cycle will allow higher RPM, etc. (see also page 16). The limit is based on heat buildup measured in watts per:

\[ \text{Watts} = \text{Torque (Nm)} \times \text{RPM} \times \text{duty cycle} \times 0.096 \]

Please consult our factory for high torque, high RPM and rapid cycling applications.

* Percent of the time the clutch is slipping, expressed as a decimal. For example, 0.5 = 50% of the time the clutch is slipping.
MOUNTING OPTIONS
Typical mounting for mechanical and pneumatic slip clutches

All Polyclutch slip clutches perform the basic function of controlling the torque between two elements. They can be supplied as a shaft-to-shaft coupling or a shaft to pulley, gear, or sprocket model.

Polyclutch custom slip clutches can be provided with non-standard bore sizes, keyways, low backlash or higher torque, minus housings and with pulley, gear or sprocket.

Example 1
Shaft to shaft
Shafts must be supported and aligned within 0.254 - 0.381 mm

Example 2
Gear, Pulley, Sprocket adapted to housing with knurl, roll pin, cap screws etc.

Example 3
Supply or rewind spool adapted to housing with knurl, pin, cap screws, set screw, key etc.

Example 4
Gear, Pulley, Sprocket modified with pins for engagement Housing is eliminated

Example 5
Gear, Pulley, Sprocket integrated as part of cartridge

Example 6
Knob adapted to housing knurl, set screw, pin, etc.

Example 7
Machine frame adapted with cap screws to housing

Example 8
Rotary position holder (hinge)
PART NUMBER IDENTIFICATION

Example:

S A S 24 - 4 mm - 6 mm

1 2 3 4 5 6

Housing Bore Size
Only provided in case of bore diameter deviation in the cartridge

Cartridge Bore Size

Series (Outer Diameter)

Installation Type
S = Shaft to shaft
O = Shaft-through
Y = Cartridge only

Torque Setting
A = Adjustable torque
F = Fixed torque (factory preset)

Type of Slip Clutch
S = Multi-Plate Clutch / P = Single-Plate Clutch / V = V-Series Slipper
E = Slip-Ease Model / A = Slip-Aire (pneumatic slip clutch)

OPTIONS

Polyclutch Slip Clutches are designed to cover a wide range of solutions. To help better fit the clutch to your specific application, here is a list of standard options:

- Bore size changes – English (inches) and metric (mm)
- High torque option, accomplished by extra springs – “H” part no. suffix
  Will increase capacity of standard adjustable slip clutches by 50%
  (note: removing springs will lower capacity, increase sensitivity)
- Keyways – English and metric – “K” part no. suffix
- Low backlash in Slipper clutch – “UL” part no. suffix
- Heavy inner plates for extra cooling – “D” part no. suffix
- Stainless steel construction – “Q” part no. prefix
- Two-plate Slipper clutch – “R” version (part no. begins with “R”)
- Plastic cover for Slipper and Slip-Aire clutches

CUSTOM CLUTCHES

If you are looking for something outside of our standard options, our engineers will work with you to help design a clutch for your specific application.
